

Lab Sheet 2

1. Create an HTML form with text input, password, radio buttons, checkboxes, dropdown select, and a textarea, styled entirely with external CSS.
2. Design a student registration form incorporating HTML5 validation attributes (required, minlength, maxlength, pattern, type='email').
3. Implement a multi-column layout using HTML `<frameset>` and `<frame>` tags (Note: legacy support practice), containing a navigation frame, header frame, and content frame.
4. Create a modern webpage layout replicating frame-like behavior using CSS Flexbox (`display: flex`) instead of HTML frames.
5. Design a user login interface inside a centered card container using CSS box-shadow, border-radius, and absolute positioning.
6. Write a CSS stylesheet utilizing CSS Grid to arrange form elements into a clean two-column grid layout.
7. Build an interactive feedback form where input fields change border color and background tint on `:focus` pseudo-class.
8. Create an HTML form featuring file upload (`type='file'`) and a styled custom submit button with CSS transitions on `:hover` and `:active` states.
9. Implement a survey form utilizing grouped form controls using `<fieldset>` and `<legend>` tags, styled with custom padding and margins.
10. Design a CSS-styled data entry table embedded inside a form container with alternating row colors and hover effects.
11. Write an HTML document utilizing inline, internal, and external CSS stylesheets to style a contact form simultaneously, observing specificity rules.
12. Create a responsive payment gateway checkout form using CSS media queries to adjust input widths on mobile screens.
13. Implement custom styled checkboxes and radio buttons using CSS pseudo-elements (`::before` and `::after`) and sibling selectors (`~`).
14. Design an HTML form with a range slider (`type='range'`) and number input, displaying live unit labels.
15. Build a search input box that expands in width smoothly using CSS `transition` when focused.
16. Create a structured employee evaluation form using CSS float and clear properties for alignment.
17. Write an HTML form incorporating hidden input fields (`type='hidden'`) to pass session data securely.
18. Design a responsive contact us page featuring an embedded form on one side and company location details on the other using CSS Flexbox.
19. Implement CSS typography rules (font-family, line-height, letter-spacing, text-transform) across all labels and placeholders in a registration form.
20. Build a multi-step user onboarding form layout using CSS display properties (`display: none` / `block`) to simulate step progression.

FORMERLY KNOWN AS UETR

Lab Sheet 2

21. Create an accessible form where every `` is explicitly linked to its corresponding `` using the `for` and `id` attributes.
22. Design a newsletter subscription widget with a floating label effect using CSS positioning.
